Preliminary analytical results and sample locality map  
for rock samples collected in 1985 and 1986, Port Moller  
and Stepovak Bay quadrangles, Alaska

by

Frederic H. Wilson, Ellen E. Harris, and E.A. Bailey

### Introduction

The accompanying map and tables show sample locations and list chemical analyses of 459 rock samples that were collected in 1985 and 1986 in conjunction with geologic mapping in the Port Moller, Stepovak Bay, and Simeonof Island quadrangles. This work was conducted under the auspices of the Alaska Mineral Resource Assessment Program (AMRAP). This report is preliminary and is intended to make this data available in a timely and expeditious manner. This report is a companion to Angeloni and others (1985) and together they contain the complete data from all samples collected through 1986 for the Port Moller AMRAP.

An attempt was made to obtain a detailed sampling of all rock types, however samples collected from areas of exposed rock alteration tend to be over-represented. The samples collected are primarily single grab samples though a few composite samples were collected. Sample locations are shown on Plate 1; as in 1982 to 1984, few samples were collected in the northwest part of the Port Moller quadrangle because this lowland area is mantled by unconsolidated Quaternary deposits. No samples were collected in the area around the Pavlof group of volcanoes.

Sample data is coded by sample type and source, by rock type and name, the outcrop form, and the 1:63,360 quadrangle from which the sample was collected. They are also coded to indicate whether the sample is "background" or "mineralized", and whether the collection is for a primary, resample, replicate analysis, or is a collection for reanalysis. Sample coding as used in appendix 1 is shown in table 1.

Samples were collected by the following investigators, with their respective two letter identifying code shown in parentheses: Linda M. Angeloni (AI), James E. Case (CE), Robert L. Detterman (DT), Stephanie Z. Gajewski (GS), John W. Miller (JM), Florence R. Weber (AWR, WR), Frederic H. Wilson (WS), and M. Elizabeth Yount (YB). These identifying codes are used on Plate 1 and in Appendix 1.

### Analytical methods

The samples were analyzed for 31 elements with a DC-arc emission spectrograph using a six-step, semiquantitative method described by Grimes and Maranzino (1968). In addition, atomic

absorption spectrophotometry was used to determine antimony, arsenic, bismuth, cadmium and zinc. Analyses for both emission spectrograph and atomic absorption (AA in table 2 and appendix 1) are in parts per million, except for Fe, Mg, Ca, and Ti which are reported in percent. No samples had detectable concentrations of either gold (Au) or thorium (Th); these elements are not shown in appendix 1. Analysts were: E.A. Bailey, J.L. Jones, R.M. O'Leary, J.L. Ryder, J.D. Hoffman, B.F. Arbogast, and C.D. Taylor.

The semiquantitative emission spectrographic analyses are reported in six steps per order of magnitude. These steps are the approximate midpoints of the class intervals shown below:

Reported value	Class interval
1.0	0.83 --- 1.2
1.5	1.2 --- 1.8
2.0	1.8 --- 2.6
3.0	2.6 --- 3.8
5.0	3.8 --- 5.6
7.0	5.6 --- 8.3

Matooka and Grimes (1976) evaluated the precision of semiquantitative emission spectrographic analyses; repeatability of a determination within plus and minus one and two reported values is approximately 83 and 96 percent respectively. Analyses done by AA are not reported on a six step scale; the quantitative values reflect both the higher precision and lower determination limits of this method.

#### Explanation of results

As in Angeloni and others (1985), the preliminary nature of this report precludes discussion of each anomalous sample, or even a discussion of how anomaly levels are determined. Nonetheless, a few areas sampled in 1985 and 1986 yielded samples that were clearly anomalous in some elements of economic interest. One of these, an area of Eocene to Oligocene sandstone and siltstone cut by a dike swarm, lies south of Mud Bay and northwest of Dorenai Bay in the Port Moller (PM) C-2 1:63,360 quadrangle. These rocks contain a number of veins with massive galena. Samples from this area include 85WS 281-285 and these are anomalous in Ag, As, Bi, Cd, Cu, Pb, Sb, Sn, and Zn.

A second area of anomalous samples also lies in the PM C-2 quadrangle. These samples, 85YB 737 and 85DT 346 and 347, were collected from an area of highly altered andesite(?) flows west of Dorenai Bay. The samples are from rubble on the ridge and include vein material. The anomalous elements include Ag, As, Cd, Cu, Mo, Pb, Sb, Sn, and Zn.

The third area we have chosen to highlight is a broad area of Zn anomalies that covers much of the central portion of the PM C-3 1:63,360 quadrangle. These samples are generally black siltstone

or mudstone, yet the anomalous zinc levels are somewhat higher than expected for this rock type. This area lies off the west end of a generally northeast to southwest belt of plutons with associated hydrothermal alteration which includes the Pyramid porphyry copper deposit (Armstrong and others, 1976).

The emphasis given here to these three locations is not meant to imply restriction of anomalous geochemical values to these areas or the three previously mentioned in Angeloni and others (1985). They are noted to guide the reader to locations where rocks containing anomalous concentrations of elements are abundant. More detailed analysis of the sample data with respect to the local geologic relations is required to evaluate the significance of the mineralization at these and other locations.
